

[name of business] is pleased to announce a new way to provide large quantities of concrete for large-scale projects. Whether your job requires a continuous stream or is located in a remote or traditionally inaccessible area, [name of business] can meet your needs with a volumetric concrete mixer.

This unique concept employs the latest technology for job-sites and is ideally suited for anyone reliant on ready mix. The key difference lies in keeping all materials, such as aggregates, separate until you're ready to pour concrete. As a result, a volumetric mixer can sit and wait if necessary, without the risk of later pouring a hot load.

Additionally, the mix design can be changed on-site as needed. This is especially helpful for large projects with different structural elements. Rather than scheduling and maneuvering multiple ready mix trucks, a single volumetric concrete mixer can supply the necessary amount as long as provisions for refilling aggregates, such as sand, are made ahead of time. Add or subtract water, accelerators, and plasticizers to suit — even as the mixer is operating.

Automatic proportioning and mixing falls in line with fast dispensing — a cubic yard in as few as five minutes. Precision concrete metering means the customer only pays for the volume order or by the volume actually used.

The Cemen Tech volumetric mixer is maneuverable, and quick. [name of business] arrives on schedule and dispenses exactly what's needed as needed.
